A person is sitting on a wooden bench in the foreground, facing away from the camera and looking towards a city skyline at night. The city is reflected in a body of water. The skyline includes several tall buildings, some of which are brightly lit. A bridge with a large tower is visible on the left side of the image. The scene is illuminated by city lights, creating a warm, yellowish glow. The text "Second Round Test Results – Progeny System" is overlaid in red on the image.

Second Round Test Results – Progeny System

REPORT OUTLINE

- » Why a 2nd Round of Testing
- » What was Tested
- » Test Sites
- » Summary Test Results
- » Detailed Test Results by Site

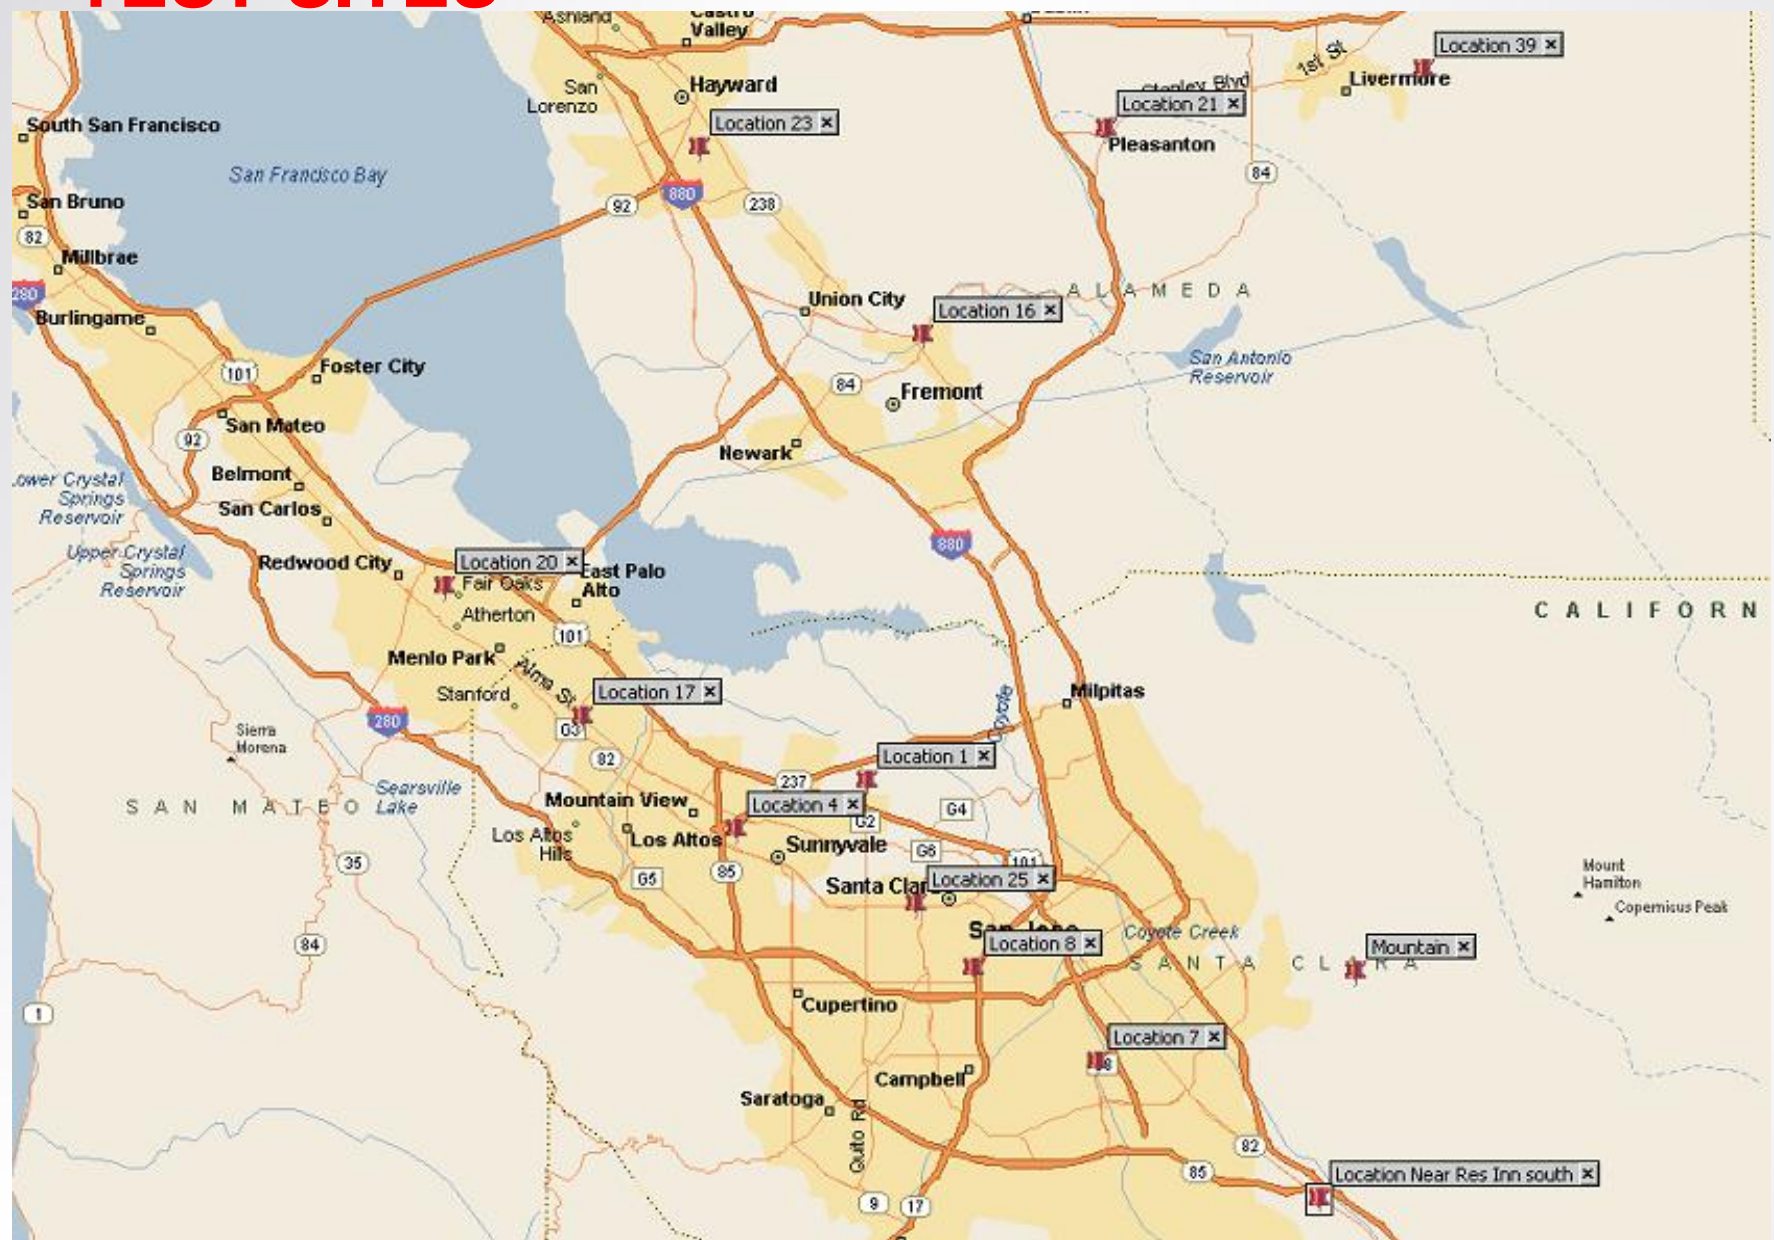

WHY A 2ND ROUND OF TESTING

- » Provide a more robust sample size of testing Packet Error Rates (PER).
 - 17 sites tested versus the original 3
 - PER testing provides the most useful information in evaluating the RF environment over a geographic area.
- » First round testing was heavily focused on Progeny's "system test" methodology and deemphasized PER testing.
- » More adequately depict the distances (in relation to Progeny beacons) whereby Part 15 devices would be impacted.
- » Itron had suspected, and was confirmed through the second round of testing, that the Progeny proposed channel utilization was not only harmful to unlicensed systems within the primary area of targeted operation but also extended well beyond.

WHAT WAS TESTED

- » Test Dates 10/16/12 - 10/19/12
- » Extensive site testing throughout the Greater San Jose Area.
- » Testing was conducted in the same manner, and with the same equipment, as the PER testing with Progeny in the summer.
- » 13 additional sites above the initial 3 that were accomplished under the first round of mutually agreed testing.
- » Packet Error Rate (PER) testing at 25 and 50 ft above ground level.
- » Channel Utilization on shared channels.

TEST SITES

SUMMARY TEST RESULTS

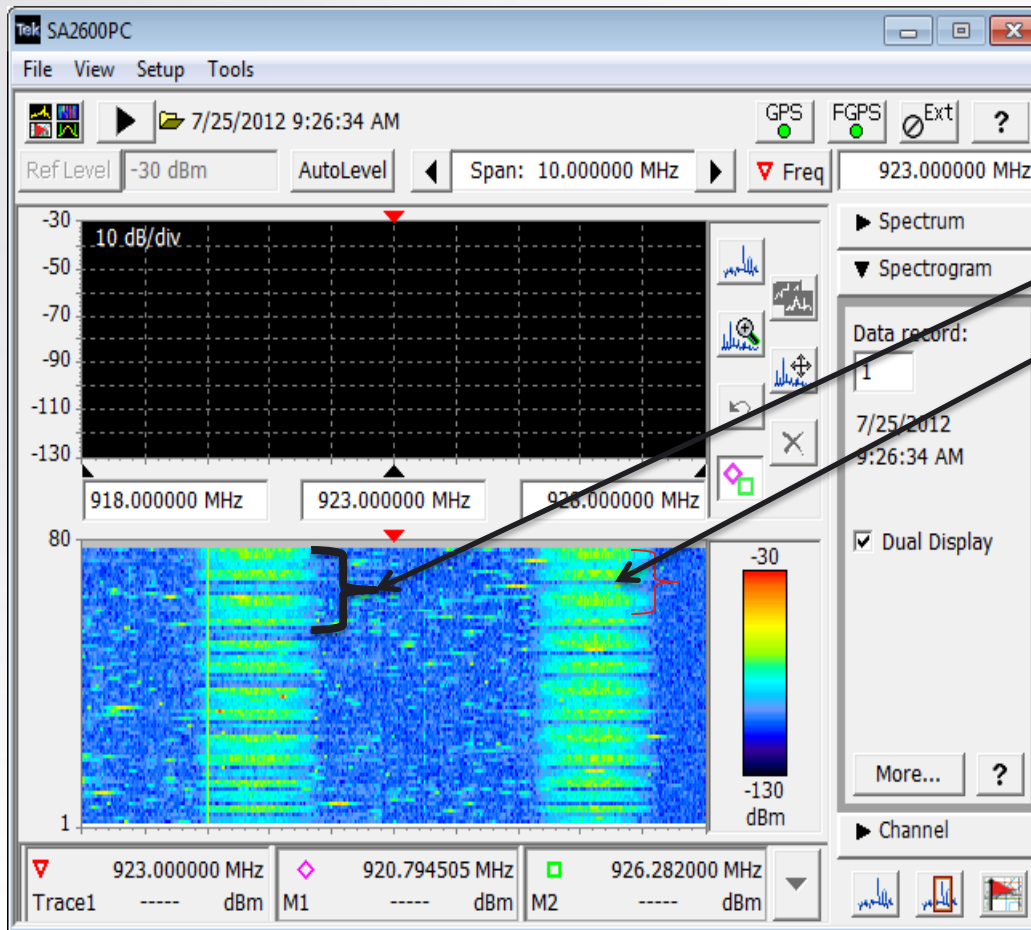

- » Virtually every site tested in the Greater San Jose area was significantly impacted by the Progeny beacons on their proposed frequencies in the proposed method of operation.
- » Moderate message reliability degradation on the 4 MHz of Progeny “shared channels “ was also seen well beyond the Progeny core service area.
 - Therefore, this potentially could affect a greater population than the Progeny’s core service area, mentioned above. This was projected through propagation modeling and validated via testing.

SUMMARY TEST RESULTS

- » Progeny waiver to allow for beacon transmitters states: “risk of harmful interference to other users of the band would in no way be affected ...”; however test results do not indicate this.
 - And compared to the original FCC intent that M-LMS systems consist of short, low duty cycle pulses from mobiles, the current high duty cycle beacon system, mounted for maximum coverage, is much more impactful than the vehicle initiated transmissions originally reflected in the original waiver.
- » Progeny’s system completely overpowers all other Part 15 systems, on their proposed channels. When Part 15 devices are mounted above the local surrounding clutter, the power differential from M-LMS to Part 15 has a more detrimental affect.

EXAMPLES OF TESTS CONDUCTED

Channel Utilization on Shared Channels - Example

Progeny System Beacon Timing

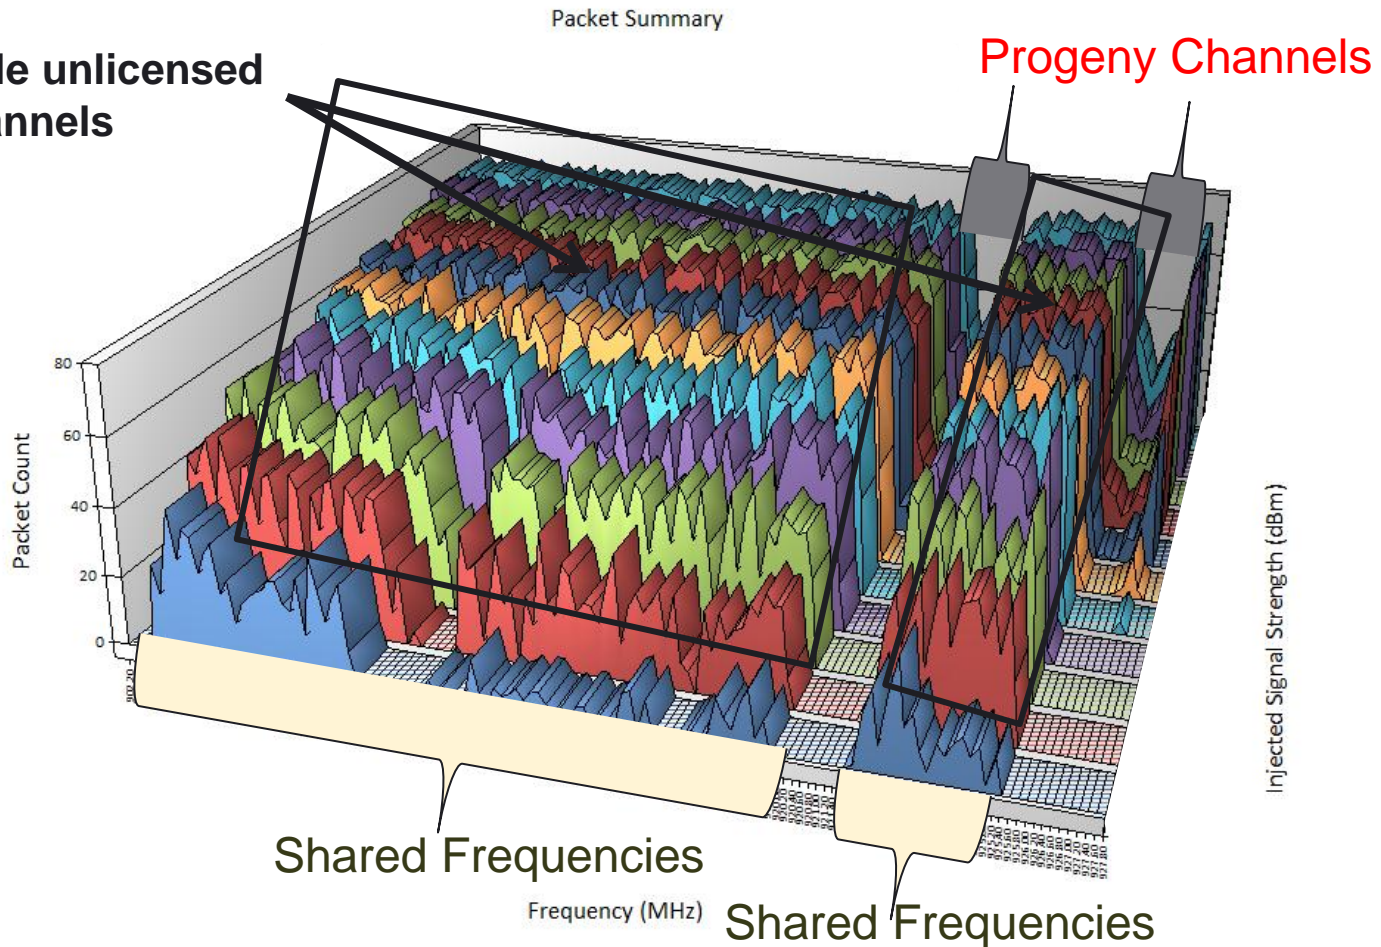

- 100 ms time slots per beacon
- Approximately 2 seconds
- 100 ms time gap, for a 90% duty cycle

Test Equipment:

- Tektronix SA 2600 operating in DSX mode
- Band Pass filter and 15 dB amplifier

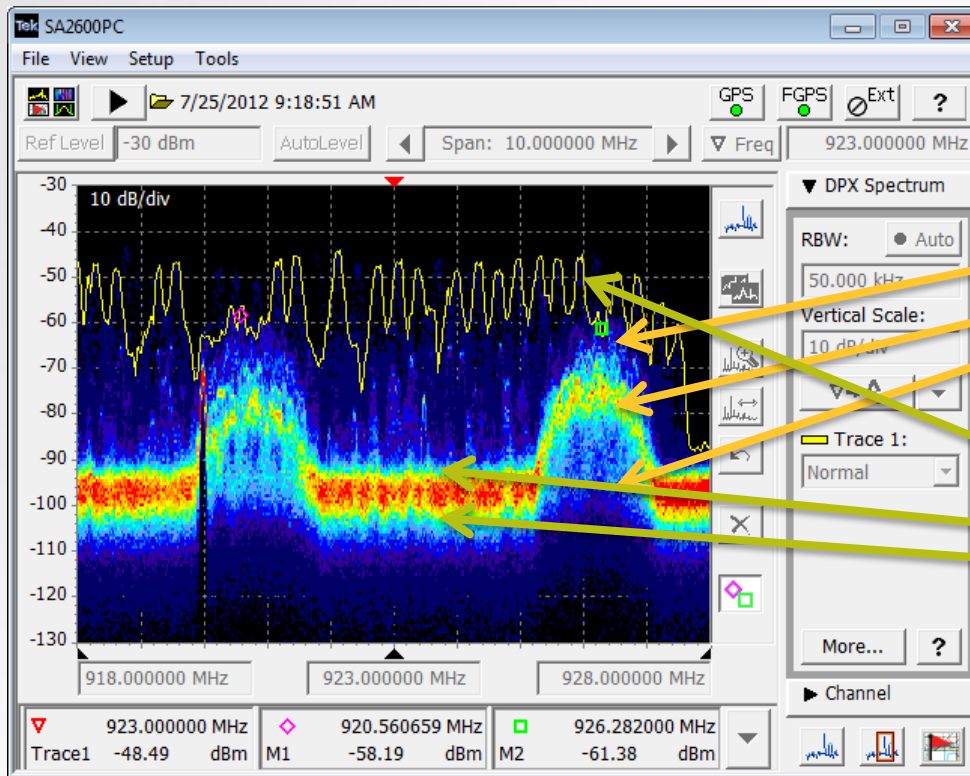

PER TEST EXAMPLE

Very reliable unlicensed
shared channels

Spectrum RF Levels Comparison – reference

Tektronix SA 2600 operating in DSX mode
With Band Pass filter and 15 dB amplifier

• Progeny

- Peak Power Detected
- Average Power Detected
- Minimum Power Detected

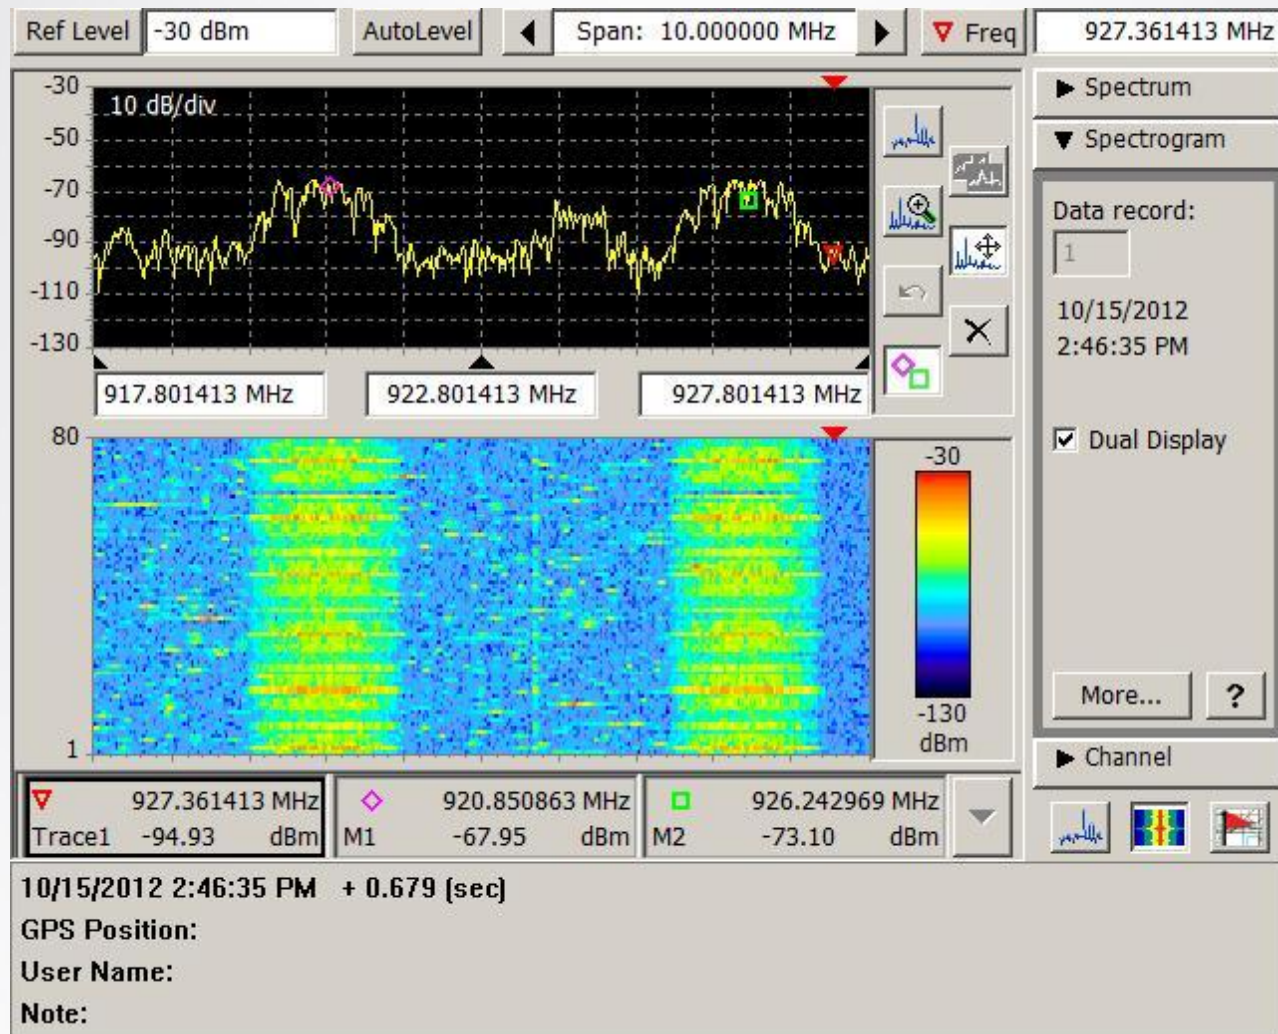

• 15.247 High Speed Hopper

- Peak Power Detected
- Average Power Detected
- Minimum Power Detected

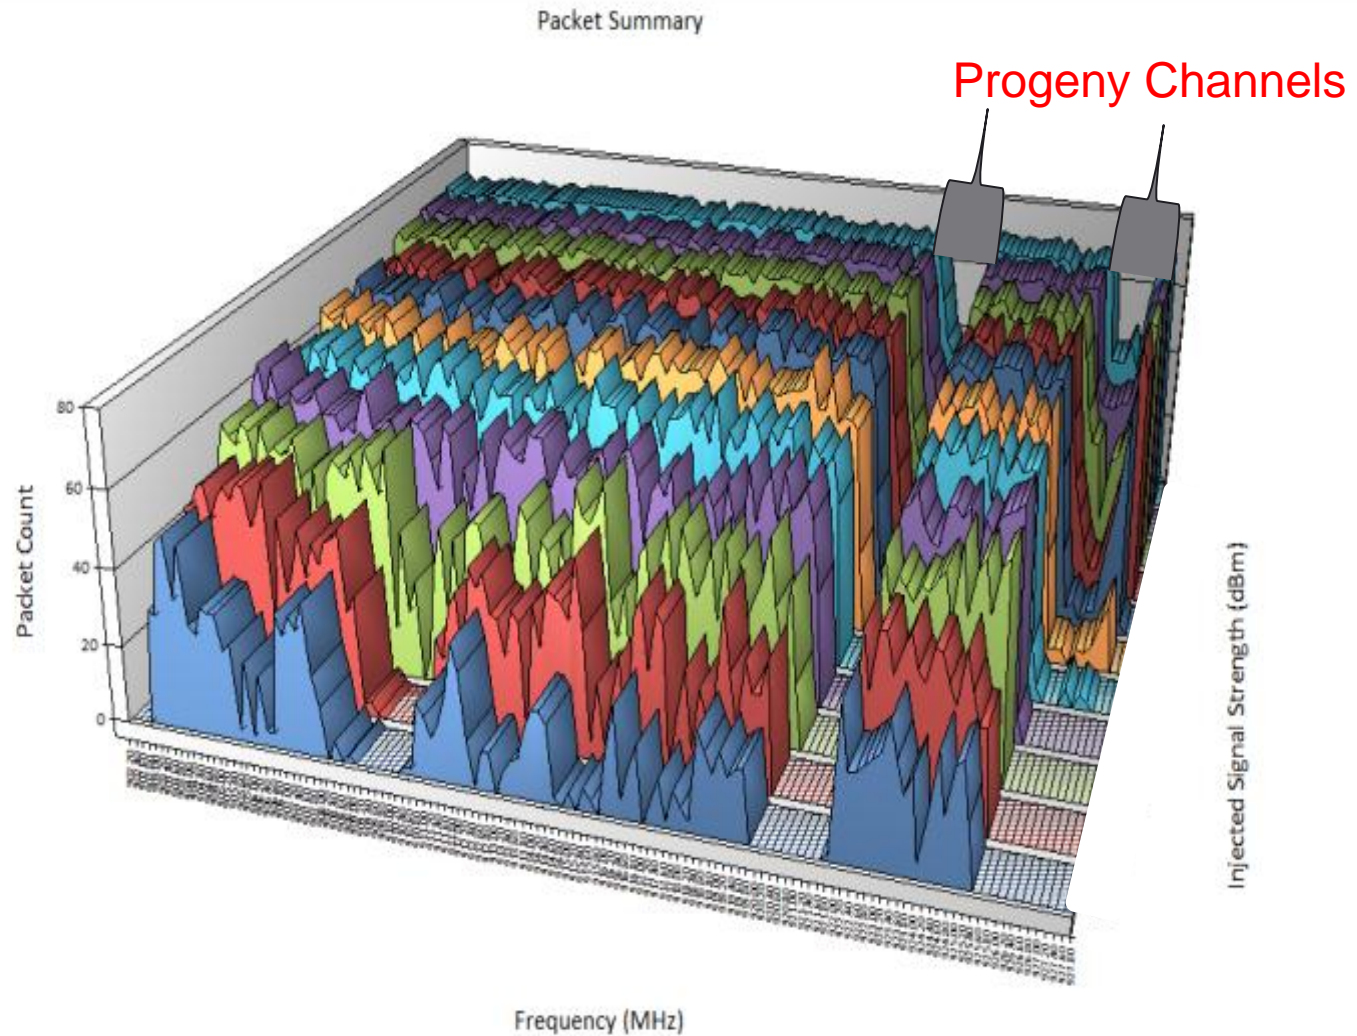

- The above depiction displays the significant difference of the Progeny RF signal average power level vs. a typical part 15 frequency hopper. Clearly the average RF power level for the composite of Progeny's proposed multiple beacon system is over 20 dB worse than a part 15 compliant system or the original intended M-LMS mobile initiated system.
